Natural, Noninvasive, Pain-free, and Permanent Solution for Thinning Hair

“Hair is everywhere — my comb, floor, drain, clothes ... is this normal?”

“My friends started giving me grief about my ‘bald spot.’”

“I think I can actually see THROUGH my hair.”

Suzanne Tedesco, a certified laser therapist, hears the same concerns from men and women every day when they first call or visit Michigan Hair and Skin Center in Troy. Many are frustrated because they can diet and exercise to help control their shape, and they can keep their smiles healthy with regular dental care, but they feel a total loss of control over their thinning hair. “All of our clients have stopped losing hair and experienced regrowth,” she says.

One client had been shaving his head and wearing hats because of his thinning hair. Within four months of starting the program, he took off his hat to reveal a full head of hair — without any thinning areas.

A woman in her late 70s didn’t think there was hope for her thinning hair. Less than halfway through the program, almost everyone she knew had made comments on how thick her hair looked. Even her hairstylist remarked that it was much denser.

Another client came to the center dismayed by his receding hairline and the bald spot that was forming on his crown. At the end of the program, there was no evidence of either problem — and his wife was ecstatic!

The Michigan Hair and Skin Center uses an FDA-approved system of low-level laser therapy (LLLT) to reverse hair loss, and make thin weak hair thicker and healthier. Most importantly, LLLT actually re-grows hair without surgery, implants, drugs, or invasive practices.

LLLT is medically tested and proven to be safe and effective. A study published in the *International Journal of Cosmetic Surgery and Aesthetic Dermatology* showed

a 93 percent increase in hair among the respondents using the laser. “Thinning hair occurs when the follicles are strangled by excessive DHT (dihydrotestosterone),” Tedesco explains. “The laser breaks away the DHT, allowing the hair follicles to get the nutrients necessary to re-grow hair.”

In fact, she says, “Anyone who still has active hair follicles can benefit from laser therapy. Even where hair isn’t visible, active follicles may still be present, making re-growth a possibility. Of course, follicles die after a few years, so the sooner someone seeks treatment, the better.”

Tedesco gives each new client a free consultation, including a digital imaging computer system evaluation of the scalp. From this image — which is magnified more than 600 times — Tedesco can determine if the follicles are still active, which will show the client’s potential for re-growth. Based on this information, she can decide if someone is a good candidate for the program.

LLLT isn’t a fad or gimmick. It has been used in Europe for more than 20 years, and has been featured on *Dateline*, the ABC news, MSNBC, and in *Women’s Health* and *Men’s Health* magazines. Recently, there was a laser hair therapy segment on CBS-TV’s *The Doctors*, and Barbara Walters of *The View* called it a “hot new product.”

The Michigan Hair and Skin Center in Troy uses Michigan’s only premium LLLT machine. The machine’s 451 lasers are housed in a salon hair dryer-like cap, and they stimulate hair growth over the entire scalp. “Similar to how sunlight stimulates the body to produce melanin, resulting in a tan, the laser light stimulates the follicles to re-grow hair,” Tedesco says. “It simply helps the body heal itself.”

While other methods of hair replacement have been

popular, LLLT is the only one that offers a permanent solution. It not only stops hair loss; it stimulates new growth — which is something drugs and transplants can’t do. Tedesco says most of her clients have had hair transplants or have tried other treatments, but their hair continued to thin. LLLT is the only solution for hair loss that doesn’t require continued treatment.

Studies completed on LLLT therapies recommend an all-inclusive, yearlong process. Tedesco says the treatment includes pain-free laser sessions, hair care products, and periodic evaluations. Twelve-month financing is available through Care Credit.

“The treatment frequency varies from one person to another, but most start out at two times per week for 30 minutes each, then decrease to once a week and so on,” Tedesco says. “Once treatment is complete, maintenance is normally not required. Most clients will continue to experience new growth six to 12 months after the program is complete. After that

time, what you have is what you’ll keep.”

During the program, clients are able to continue their normal hair care regime, including coloring and styling. The treatment simply stimulates natural hair growth at the normal rate of about a half-inch per month.

LLLT is also used as a natural, holistic treatment for the skin. The all-inclusive three- or six-month laser program, combined with organic skin care products that are unadulterated by fillers or chemicals, increases collagen production and cellular activity. This results in minimization of fine lines, wrinkles, crow’s feet, blemishes, age spots, and sun damage. It can also be used for calming acne, rosacea and psoriasis. “That’s one nice thing about using cool-level laser treatments — it’s pain-free, noninvasive, and there are no chemicals involved,” Tedesco says.

The Michigan Hair and Skin Center was established by Carol Wagner to provide solutions for thinning hair and problem skin. Clients can enjoy natural and permanent results in a very relaxed and discreet setting that many clients describe as “serene.” Call today to set up your complimentary computerized scalp evaluation with their highly trained and professional staff.
